4 Open Questions

- Most security analysis of symmetric primitives is based on their representation, not the primitive itself
- We should make sure that the result of our analysis is independent of the representation
- <u>Here:</u> Focus on round function
- One common design strategy: Substitution-Permutation Network (SPN)

$\begin{array}{l} {}_{\rm RUHR-UNIVERSIT\ddot{a}t\ bochum}\\ {\rm (SPN-)Round\ Function\ Decomposition} \end{array}$

■ <u>Given:</u> A representation of an SPN round function

RUB

- Question: Is this representation unique?
- Up to reordering the S-boxes
- Up to linear equivalence of the S-boxes
- While maximizing the number of S-boxes

Using two linear layers may seem strange More sensible to use just one for cipher design But: Can see additional linear layer as part of the part round

- <u>But:</u> Can see additional linear layer as part of the next round
- Essentially looking at a linear equivalent cipher/primitive

$$\left(L_2 \circ \begin{pmatrix} S_1 \\ \vdots \\ S_n \end{pmatrix} \circ L_1 \right)^r = L_1^{-1} \circ \left(L_1 \cdot L_2 \circ \begin{pmatrix} S_1 \\ \vdots \\ S_n \end{pmatrix} \right)^r \circ L_1$$

- Both versions should have the same security properties
- <u>Conclusion</u>: More natural to allow two linear layers when decomposing

RUB

Definition

A function F has maximal differential uniformity if $F(x) + F(x + \alpha)$ is constant for some non-zero α .

Lemma

F has maximal differential uniformity if and only if F is affine equivalent to a function of the form

$$G\begin{pmatrix} x\\ y \end{pmatrix} = \begin{pmatrix} f(x)\\ g(x) + y \end{pmatrix}.$$

RUHR-UNIVERSITÄT BOCHUM Maximal Linearity

Definition

A function F has maximal linearity if $\alpha^{T} \cdot F$ is affine for some non-zero α .

Lemma

F has maximal linearity if and only if F is affine equivalent to a function of the form

$$H\begin{pmatrix} x\\ y \end{pmatrix} = \begin{pmatrix} x\\ h\begin{pmatrix} x\\ y \end{pmatrix} \end{pmatrix}.$$

RUHR-UNIVERSITÄT BOCHUM Uniqueness of Decompositions

RUB

Theorem

A (maximal) decomposition is not unique if and only if one S-box has maximal differential uniformity and another one has maximal linearity.

Corollary

Functions without unique (maximal) decomposition are exactly those affine equivalent to ones of the form

$$\mathbf{R}\begin{pmatrix} \mathbf{x}_1\\ \mathbf{x}_2\\ \mathbf{x}_3\\ \mathbf{x}_4 \end{pmatrix} = \begin{pmatrix} \mathbf{f}(\mathbf{x}_1)\\ \mathbf{g}(\mathbf{x}_1) + \mathbf{x}_2\\ \mathbf{x}_3\\ \mathbf{h}\begin{pmatrix} \mathbf{x}_3\\ \mathbf{x}_4 \end{pmatrix} \end{pmatrix} \begin{cases} \mathbf{S}\text{-box(es)} \\ \mathbf{S}\text{-box(es)} \end{cases}$$

2 Some Intuition

3 An Example: DEFAULT

4 Open Questions

RUB

- Ideally, we would like to decompose iteratively
- Starting with one S-box (the whole round function), we would like to split one S-box into two, and iterate until no S-box can be decomposed anymore
- <u>Problem:</u> The choice of one S-box can affect other S-boxes

ruhr-universität bochum Uniqueness of Decompositions – Some Intuition

RUB

 \blacksquare Decompositions can be modeled using projections

- If $V = U_1 \oplus U_2$ for a vector space V and subspaces U_1, U_2 this means that $v \in V$ can be written as $u_1 + u_2$ for unique $u_1 \in U_1$ and $u_2 \in U_2$
- $\pi_i^U: V \to U_i, v \mapsto u_i$ are the projections onto those subspaces
- \blacksquare U_i is the input (before applying the first linear layer) to the i-th S-box
- Example: $U_1 = \mathbb{F}_2^{n/2} \times 0^{n/2}$, $U_2 = 0^{n/2} \times \mathbb{F}_2^{n/2}$ and $S_1, S_2 : \mathbb{F}_2^{n/2} \to \mathbb{F}_2^{n/2}$

$$\begin{pmatrix} S_1(\mathbf{x}_1) \\ S_2(\mathbf{x}_2) \end{pmatrix} + \begin{pmatrix} S_1(0) \\ S_2(0) \end{pmatrix} = \begin{pmatrix} S_1(\mathbf{x}_1) \\ S_2(0) \end{pmatrix} + \begin{pmatrix} S_1(0) \\ S_2(\mathbf{x}_2) \end{pmatrix}$$
$$= \begin{pmatrix} S_1 \\ S_2 \end{pmatrix} \circ \pi_1^{\mathrm{U}} \begin{pmatrix} \mathbf{x}_1 \\ \mathbf{x}_2 \end{pmatrix} + \begin{pmatrix} S_1 \\ S_2 \end{pmatrix} \circ \pi_2^{\mathrm{U}} \begin{pmatrix} \mathbf{x}_1 \\ \mathbf{x}_2 \end{pmatrix}$$

 \blacksquare Decomposing an S-box is now equivalent to decomposing one of the subspaces U_i

ruhr-universität bochum Uniqueness of Decompositions – Some Intuition

■ Using R from above

• One decomposition: $U_1 = \{(x_1, x_2, 0, 0)^T | x_1, x_2\}\}$ and $U_2 = \{(0, 0, x_3, x_4)^T | x_3, x_4\}\}$

RUB

$$\mathbf{R} \circ \pi_{1}^{\mathrm{U}} \begin{pmatrix} \mathbf{x}_{1} \\ \mathbf{x}_{2} \\ \mathbf{x}_{3} \\ \mathbf{x}_{4} \end{pmatrix} = \begin{pmatrix} \mathbf{f}(\mathbf{x}_{1}) \\ \mathbf{g}(\mathbf{x}_{1}) + \mathbf{x}_{2} \\ \mathbf{0} \\ \mathbf{h}(\mathbf{0}) \end{pmatrix}, \mathbf{R} \circ \pi_{2}^{\mathrm{U}} \begin{pmatrix} \mathbf{x}_{1} \\ \mathbf{x}_{2} \\ \mathbf{x}_{3} \\ \mathbf{x}_{4} \end{pmatrix} = \begin{pmatrix} \mathbf{I}(\mathbf{0}) \\ \mathbf{g}(\mathbf{0}) \\ \mathbf{x}_{3} \\ \mathbf{h} \begin{pmatrix} \mathbf{x}_{3} \\ \mathbf{x}_{4} \end{pmatrix} \end{pmatrix}$$

• Another decomposition: $W_1 = U_1$ and $W_2 = \{(0, x_3, x_3, x_4)^T | x_3, x_4\}\}$

$$\mathbf{R} \circ \pi_{1}^{\mathbf{W}} \begin{pmatrix} \mathbf{x}_{1} \\ \mathbf{x}_{2} \\ \mathbf{x}_{3} \\ \mathbf{x}_{4} \end{pmatrix} = \begin{pmatrix} \mathbf{f}(\mathbf{x}_{1}) \\ \mathbf{g}(\mathbf{x}_{1}) + \mathbf{x}_{2} + \mathbf{x}_{3} \\ \mathbf{0} \\ \mathbf{h}(\mathbf{0}) \end{pmatrix}, \mathbf{R} \circ \pi_{2}^{\mathbf{W}} \begin{pmatrix} \mathbf{x}_{1} \\ \mathbf{x}_{2} \\ \mathbf{x}_{3} \\ \mathbf{x}_{4} \end{pmatrix} = \begin{pmatrix} \mathbf{f}(\mathbf{0}) \\ \mathbf{g}(\mathbf{0}) + \mathbf{x}_{3} \\ \mathbf{x}_{3} \\ \mathbf{h} \begin{pmatrix} \mathbf{x}_{3} \\ \mathbf{x}_{4} \end{pmatrix} \end{pmatrix}$$

ruhr-universität bochum Uniqueness of Decompositions – Some Intuition

$$\mathbf{R} \begin{pmatrix} \mathbf{x}_{1} \\ \mathbf{x}_{2} \\ \mathbf{x}_{3} \\ \mathbf{x}_{4} \end{pmatrix} = \begin{pmatrix} \mathbf{f}(\mathbf{x}_{1}) \\ \mathbf{g}(\mathbf{x}_{1}) + \mathbf{x}_{2} \\ \mathbf{x}_{3} \\ \mathbf{h} \begin{pmatrix} \mathbf{x}_{3} \\ \mathbf{x}_{4} \end{pmatrix} \end{pmatrix} = \begin{pmatrix} \mathbf{f}(\mathbf{x}_{1}) \\ \mathbf{g}(\mathbf{x}_{1}) + (\mathbf{x}_{2} + \mathbf{x}_{3}) + \mathbf{x}_{3} \\ \mathbf{g}(\mathbf{x}_{1}) + (\mathbf{x}_{2} + \mathbf{x}_{3}) + \mathbf{x}_{3} \\ \mathbf{x}_{3} \\ \mathbf{h} \begin{pmatrix} \mathbf{x}_{3} \\ \mathbf{x}_{4} \end{pmatrix} \end{pmatrix}$$
$$= \begin{pmatrix} \mathbf{1} & \mathbf{0} & \mathbf{0} & \mathbf{0} \\ \mathbf{0} & \mathbf{1} & \mathbf{1} & \mathbf{0} \\ \mathbf{0} & \mathbf{0} & \mathbf{0} & \mathbf{1} \end{pmatrix} \mathbf{R} \begin{pmatrix} \mathbf{1} & \mathbf{0} & \mathbf{0} & \mathbf{0} \\ \mathbf{0} & \mathbf{1} & \mathbf{1} & \mathbf{0} \\ \mathbf{0} & \mathbf{0} & \mathbf{1} & \mathbf{0} \\ \mathbf{0} & \mathbf{0} & \mathbf{0} & \mathbf{1} \end{pmatrix} \begin{pmatrix} \mathbf{x}_{1} \\ \mathbf{x}_{2} \\ \mathbf{x}_{3} \\ \mathbf{x}_{4} \end{pmatrix}$$

RUB

R is self linear equivalent, where the linear equivalence mixes the S-boxesMatrices don't have to be identical in general

2 Some Intuition

3 An Example: DEFAULT

4 Open Questions

RUHR-UNIVERSITÄT BOCHUM An Example: DEFAULT

RUB

■ DEFAULT¹ is an SPN block cipher aimed at fault attack resilience

- Two different round functions:
 - Inner part aimed at classical security
 - Outer part aimed at fault attack resilience
- S-box of outer part

$$S\begin{pmatrix}x_1\\x_2\\x_3\\x_4\end{pmatrix} = \begin{pmatrix}x_1 + x_2 + x_3\\(x_1 + x_4)(x_2 + x_3) + x_1 + x_2\\x_2 + x_3 + x_4\\(x_1 + x_4)(x_2 + x_3) + x_3 + x_4\end{pmatrix}$$

- S-box has both, maximal differential uniformity and linearity
- With that, its round function representation is not unique!

2 Some Intuition

3 An Example: DEFAULT

4 Open Questions

- Are there any security implications from a non-unique decomposition?
- Are there implications for implementing a cipher/primitive?
- Besides DEFAULT, can we find other (SPN-)ciphers that don't have a unique decomposition?
- Are there properties that assume a unique decomposition (that also are evaluated for ciphers without one)? (One Example: Alignment²)

Thank you for your attention!
